

# The Perception Of The Environment

**Time perception** Time perception or chronoception is the subjective experience, or sense, of time, which is measured by someone's own perception of the duration of the indefinite

**Emotion perception** Emotion perception refers to the capacities and abilities of recognizing and identifying emotions in others, in addition to biological and physiological

**Action-specific perception** Action-specific perception, or perception-action, is a psychological theory that people perceive their environment and events within it in terms of their ability

**Face perception** Facial perception is an individual's understanding and interpretation of the face. Here, perception implies the presence of consciousness and hence excludes

**Active perception** In other. Active perception is the selecting of behaviors to increase information from the flow of data those behaviors produce in a particular environment

**Plant perception (physiology)** Botanical research has. Plant perception is the ability of plants to sense and respond to the environment by adjusting their morphology and physiology

**Visual perception** is an active process in which the brain interprets and organizes sensory information rather than simply recording visual input. Perception is influenced...

**Perception** All perception involves signals that go through the nervous system, which in turn Perception (from Latin perceptio 'gathering, receiving') is the identification, interpretation and organization of sensory information, in order to represent and understand the presented information or environment. All perception involves signals that go through the nervous system, which in turn result from physical or chemical stimulation of the sensory system. to represent and understand the presented information or environment. Vision involves light striking the retina of the eye; smell is mediated by odor molecules; and hearing involves pressure waves

Perception depends on complex functions of the nervous system, but subjectively

seems mostly effortless because this processing happens outside conscious awareness. Since the rise of experimental psychology in the 19th century, psychology's... 59527c1b5b

**Speech perception** Speech perception is the process by which the sounds of language are heard, interpreted, and understood. The study of speech perception is closely linked 59527c1b5b

**Philosophy of perception** The philosophy of perception is concerned with the nature of perceptual experience and the status of perceptual data, in particular how they relate to 59527c1b5b

Perception is not only the passive receipt of these signals, but it is also shaped by the recipient's learning, memory, expectation, and attention. Sensory input is a process that transforms this low-level information to higher-level information (e.g., extracts shapes for object recognition). The following process connects a person's concepts and expectations (or knowledge) with restorative and selective mechanisms, such as attention, that influence perception. 59527c1b5b

**Visual perception** Visual perception is the ability to detect light and use it to form an image of the surrounding environment. Photodetection without image formation is classified as light sensing. Photodetection without image formation is Visual perception is the ability to detect light and use it to form an image of the surrounding environment. The resulting perception is also known as vision, sight, or eyesight (adjectives visual, optical, and ocular, respectively). In most vertebrates, visual perception can be enabled by photopic vision (daytime vision) or scotopic vision (night vision), with most vertebrates having both. The visible range of light is defined by what is readily perceptible to humans, though the visual perception of non-humans often extends beyond the visual spectrum. The various physiological components involved in vision are referred to collectively as the visual system, and are the focus of much research in linguistics, psychology, cognitive science, neuroscience, and molecular biology, collectively referred to as vision science. Visual perception detects light (photons) in the visible spectrum reflected by objects in the environment or emitted by light sources 59527c1b5b
