On 30 July 2018, the alliance went head to head with the Emmerson Mnangagwa-led ZANU–PF in Zimbabwe's historic elections. The alliance was narrowly edged by ZANU–PF in the presidential election, with Mnangagwa receiving 50.8% of the vote to MDC Alliance's Nelson Chamisa's 44.3%. The election results have received international attention as possible fraud. 799d04336a

Leading-order term terms in the equation(s) will change as the variables change, and hence, which terms are leading-order may also change. The sizes of the different terms in the equation(s) will change as the variables change, and hence, which terms are leading-order may also change. A common and powerful way of simplifying The leading-order terms (or leading-order corrections) within a mathematical equation, expression or model are the terms with the largest order of magnitude 799d04336a

== Basic example == 799d04336a The main behaviour may be captured sufficiently well by just the strictly leading-order terms, or it may be decided that slightly smaller terms should also be included. In which case, the phrase "leading-order terms" might be used informally to mean this whole group of terms. The behaviour produced by just the group of leading-order terms is called the leading-order behaviour of

the model. 799d04336a == Operation ==

Leading-edge slat With slats deployed an aircraft can fly at slower speeds, allowing it to take off and land in shorter distances. Air from below the slat flows through the slot and replaces the boundary layer that has travelled at high speed around the leading edge of the slat, losing a significant amount of its kinetic energy due to skin friction drag. When retracted, the slat lies flush with the rest of the wing. A slat is deployed by sliding forward, opening a slot between the wing and the slat. When deployed, slats allow the wings to operate at a higher angle of attack before stalling. When retracted, the slat lies flush with the rest of the wing. A slat is an aerodynamic surface on the leading edge of the wing of a fixed-wing aircraft. Slats are retracted in normal flight to minimize drag. They are used during takeoff and landing in addition to when performing low-speed maneuvers which may take the aircraft close to a stall. Organizational change management (OCM) considers the full organization and what needs to change, while change management may be used solely to refer to how people and teams are affected by such organizational transition. It deals with many different disciplines, from behavioral and social sciences to information technology and business solutions. 799d04336a The word comes from lead strips that were put between set lines of lead type, hence the pronunciation "ledding" and not "leeding". The practice became popular in the eighteenth century. 799d04336a Three of the member parties were splinters from the original Movement for Democratic Change and each other. The bloc was formed to contest the 2018 election. The MDC Alliance was led by Nelson Chamisa who replaced Morgan Tsvangirai as President of the MDC-T after Tsvangirai died on the 14 February 2018 after a long fight against colon cancer. 799d04336a == History == 799d04336a

A common and powerful way of simplifying and understanding a wide variety of complicated mathematical models is to investigate which terms are the largest (and therefore most important), for particular sizes of the variables and parameters, and analyse the behaviour produced by just these terms (regarding the other smaller terms as negligible). This gives the main behaviour –the true behaviour is only small deviations away from this. 799d04336a

Leading zero Often, leading zeros are found on non-electronic digital displays A leading zero is any 0 digit that comes before the first nonzero digit in a number string in positional notation. However, for digits after the decimal point, the leading zeros between the decimal point and the first nonzero digit are necessary for conveying the magnitude of a number and cannot be omitted (ex. For example, James Bond's famous

identifier, 007, has two leading zeros. Any zeros appearing to the left of the first non-zero digit before the decimal point do not affect its value, and can be omitted (or replaced with blanks) with no loss of information. after the last nonzero digit – can be omitted without changing the meaning (ex. 00100). 00100). Therefore, the usual decimal notation of integers does not use leading zeros except for the zero in the ones place, which would be denoted as an empty string otherwise. 001), while trailing zeros – zeros occurring after the decimal point and after the last nonzero digit – can be omitted without changing the meaning (ex 799d04336a

In the 2021 Census of Population conducted by Statistics Canada, Leading Tickles had a population of 296 living in 138 of its 189 total private dwellings, a change of 1.4% from its 2016 population of 292. With a land area of 26.59 km² (10.27 sq mi), it had a population density of 11.1/km² (28.8/sq mi) in 2021. 799d04336a In hand typesetting, leading is the thin strips of lead (or aluminium) that were inserted between lines of type in the composing stick to increase the vertical distance between

them. The thickness of the strip is called leading and is equal to the difference between the size of the type and the distance from one baseline to the next. For instance, given a type size of 10 points and a distance between baselines of 12 points, the leading would be 2 points. This combination of type size and distance between baselines is described as "10 on 12 pt", which may appear in a book's colophon as "Typeset in 10 on 12 pt Times Roman", or similar.

Leading lights Leading lights are sometimes designed to be movable, allowing their position to be shifted in the event of a change in the safe channel; Leading lights, also known as range lights in the United States, are a pair of light beacons used in navigation to indicate a safe passage for vessels entering a shallow or dangerous channel; they may also be used for position fixing. Range lights are often illuminated day and night. Massachusetts in 1788. At night, the lights are a form of leading line that can be used for safe navigation. The beacons consist of two lights that are separated in distance and elevation, so that when they are aligned, with one above the other, they provide a bearing 799d04336a

As change management becomes more necessary in the business cycle of organizations, it is beginning to be taught as its own academic discipline at universities. There are a growing number of universities with research units dedicated to the study of organizational change. One common type of organizational change may be aimed at reducing outgoing costs while maintaining
